Dear Hiring Manager,

I am reaching out to be considered for suitable IT opportunities in your recruitment network. My profile sits between software development, functional analysis, automation, and production support: I like getting close to the business problem, turning it into a clear technical plan, and then helping deliver the working system rather than stopping at documentation.

In my current role at RF-Technologies, I work on business-critical internal applications used for operational workflows, data analysis, stock visibility, pricing logic, and approval processes. My work covers requirement analysis, technical implementation, debugging, and release quality. I have also helped build Azure DevOps test pipelines to make releases more reliable across multiple internal tools.

Technically, I am comfortable across React, Vue, TypeScript, C#.NET, Node.js, SQL Server, REST APIs, Azure, Docker, Git, CI/CD, xUnit, Jest, and Playwright. I also bring practical automation experience, including Power Automate and SharePoint approval flows, and an n8n plus Claude API workflow that reads tender documents shared in Microsoft Teams and turns them into usable quote information.

Before that, I built a test automation platform as a student developer: a React, Node.js, and Firebase application that allowed non-technical users to create automated tests, with OpenAI API support for generating test code. That project strengthened the part of my profile I want to keep growing: building tools that are technically solid but still understandable and useful for the people who rely on them.

I am open to software development, functional analyst, application support, automation, integration, and junior-to-mid level full-stack roles where ownership, communication, and practical problem solving matter. I am especially interested in teams where I can keep improving both my engineering depth and my ability to translate business needs into reliable systems.

Please find my CV attached. I would be happy to discuss any roles where my mix of development, analysis, automation, and production-support experience could be a good fit.

Kind regards,
Stan Verbruggen
