STAN VERBRUGGEN

Automation Engineer & Full-Stack Developer

Oosterzele, Belgium | +32 477 27 70 64 | stanverbruggen@protonmail.com | sjvportfolio.netlify.app | GitHub | LinkedIn

PROFESSIONAL EXPERIENCE

Automation Engineer at Attentia — *Oct 2026 – Present*

- Build n8n automations, MCP servers and agent setups for colleagues, and provide 2nd-line development support on the internal systems they run on
- Building around 30 n8n workflows for payments, finance exports and CRM data (proof of concept / UAT, not yet in production): every incoming file validated and fingerprinted so duplicates are refused, one run at a time, a log written before anything goes out, and retries that fail loudly; custom n8n nodes where the built-in ones fell short
- Built a 2nd-line support agent setup on Claude Code: a chief agent with twelve specialist subagents that read systems, match errors to runbooks and keep documentation in line with the code; monitors diagnose and propose fixes but never apply them
- Built a personal work agent that plans the day from open to-dos and runs bigger work through analyst, planner, developer, tester and reviewer agents, with hooks that block or ask about secrets, force pushes, destructive SQL and deploys

Functional Analyst & Lead Developer at RF-Technologies — *Sep 2025 – Oct 2026*

- Built the MCP servers the company's AI agents used to reach its own systems (ERP, CRM, data platform, time registration, SQL); primary author of five (80–100% of commits), with per-user Microsoft sign-in instead of a shared service account, hosted on Azure App Service and released from UAT to production through a pipeline
- Most of that work went into reliability: token refresh, timeouts, retries on 429 and 503, and caching
- Functional analysis, technical lead and production debugging on the business-critical applications: a modular workflow and compliance platform that talks to other systems through events, and a data analysis tool with controlled schema changes
- Built a visual discount-rule editor and inventory tracking modules, and pulled the Playwright suites together into one automated Azure DevOps test pipeline
- Moved manual approval workflows into Power Automate and SharePoint, and built an n8n + Claude API flow that picks up documents dropped in Microsoft Teams and returns the details needed to start a quote
- Explored a Microsoft Fabric medallion setup that AI agents could query (exploration only)

Software Developer Intern at Brightest — *Feb – May 2025*

- Co-built a no-code test automation framework (React, Node.js, Firebase, OpenAI API, Puppeteer): users build website tests without code while the OpenAI API writes the test code, pick page elements by clicking on a screenshot, and work on tests together on a kanban board

Earlier experience (alongside studies) — *2021 – 2025*

- Student Admin Assistant, FOD Wapens: managed permits, processed data, handled archiving
- Student Logistics Assistant, Hoppy: maintained and transported shared scooters/bikes

SELECTED PROJECTS

Recruitment CRM (client project, in production) — *Vue 3 / TypeScript / Firebase · 2026*

- Most recent full-stack build: a CRM a field-marketing and recruitment agency uses every week, still receiving small same-day releases
- Shift planning with admin approval, shared to the team's WhatsApp group from the planning view; a lead funnel with click-to-call and per-recruiter figures; a Leaflet map with drawn zones and a visit log
- Three roles plus a team-leader flag across multiple offices; runs on Firebase with no server code, so every access rule lives in Firestore rules with their own test suite against the emulator; iOS and Android apps from the same code with Capacitor

Battery-swap route manager (personal concept) — *.NET 9 / React Native · 2025*

- Full-stack concept for planning battery-swap rounds for shared e-scooters, modelled on 23 regions across four countries and run on seeded data, not a live system
- .NET 9 backend split into domain, application, infrastructure and API projects, with Entity Framework on SQL Server; routes planned with Google OR-Tools from a GPS distance matrix to fit the swapper's shift; flags low-battery and out-of-zone vehicles
- React Native app with separate views for admins, fleet managers and swappers; JWT sign-in with three roles, no secrets in config files

Personal agent team (in daily use) — *Claude Code / Obsidian · 2026*

- My own assistant on Claude Code: one manager agent hands work to specialists for LinkedIn, job search, finances, mail and laptop health, plus a small dev team; they share memory through an Obsidian vault
- Each agent keeps capped memory, mistakes and log notes; skills live in one registry a script rebuilds and checks for drift; a daily check only raises an alert when something is actually wrong

Time2Bill — *Flutter / Firebase · 2025*

- Time tracking and invoicing for freelancers, from a live timer to PDF invoices, UBL XML export and Peppol e-invoicing; web, iOS and Android from one Flutter codebase

More on the portfolio: AI document-to-quote automation, a booking system (Vue + Express/TypeScript), and the work above in more detail.

SKILLS

Agents & AI: Claude Code (subagents, hooks, skills), MCP servers, Claude API, OpenAI API

Automation: n8n (incl. custom nodes), Power Automate, REST / SOAP / OData, OAuth2 & mTLS

Frontend: Vue 3, TypeScript, Pinia, Tailwind CSS, React, React Native, Flutter

Backend: .NET / C#, Entity Framework, Node.js, SQL Server, Oracle SQL, Firebase / Firestore

Cloud & delivery: Azure (App Service, Entra ID), Azure DevOps CI/CD, GitHub Actions, Playwright, Docker, Git

Analysis: functional analysis, requirements, process mapping, production debugging

Languages: Dutch (native), English (fluent), French (intermediate)

EDUCATION & CERTIFICATIONS

Associate Degree in Software Development (Graduaat Programmeren) — *2025*

Oracle Database 12c: SQL Fundamentals Certification — *2022*
